AGENT FROG

Full Workflow & Design Brief

A combined product flow, homepage concept, navigation model, and implementation guide

Core idea: onboarding comes first. The personalized homepage is the destination.

1. Core Vision

AGENT FROG should feel like an intricately designed, premium digital tailoring studio, not a stereotypical SaaS dashboard. The experience should have depth, character, and craftsmanship without becoming visually overwhelming. It should feel personal, sophisticated, calm, and functional.

The user first enters through an immersive landing page, completes guided onboarding, confirms their career profile, and only then arrives at a personalized homepage. That homepage is the user's tailoring studio: an open environment with floating workspace entry points and an optional hidden navigation drawer.

Design principles

Depth without clutter: use material, light, shadow, texture, and composition instead of excessive UI elements.

One clear priority per screen; make the next action immediately understandable.

Personalization over generic dashboards; adapt to the user's profile and application history.

Craftsmanship over decoration; every detail should reinforce identity or improve usability.

Progressive disclosure; show what is needed now and reveal secondary controls on demand.

Consistency without monotony; keep one design language while allowing layouts to suit different tasks.

Function before spectacle; keep the experience fast, readable, accessible, and usable.

Professional output; the app can be atmospheric, but exported resumes and cover letters must remain conventional and ATS-friendly.

2. Full User Journey at a Glance

01 Landing page: Immersive tailor-shop entrance and primary upload button.

02 Upload materials: Upload master resume and master achievement document.

03 Mini quiz: Answer the team's existing questions in a focused guided sequence.

04 Career profile review: Review, correct, and confirm extracted career information.

05 Personalized homepage: Enter the tailoring studio, with floating workspace boxes and hidden navigation.

06 Workbench / new application: Add a job description and compare it against the confirmed profile.

07 Tailoring and review: Generate, inspect, accept/reject, edit, and revert resume/cover-letter changes.

08 Final review and export: Check quality and download approved, ATS-friendly documents.

09 Prep and application management: Practice interviews, manage saved applications, and update profile/materials.

3. Stage One: Landing Page

Purpose: establish the AGENT FROG identity and invite the user into onboarding. Do not land new users directly on a dashboard.

Create a cozy, old-fashioned tailor-shop atmosphere with rich wood tones, warm lighting, soft background blur, and layered environmental depth.

Keep the composition calm and uncluttered. Avoid a flat wallpaper feel or an obvious stock-photo backdrop.

Position “AGENT FROG” prominently near the upper-middle of the screen.

Display the subtitle: “Tailor your application.”

Show one prominent purple button: “Upload your materials here →”.

Use subtle atmospheric motion. Avoid filling the screen with stereotypical tailor props or placing decorative objects everywhere.

Clicking the button transitions smoothly into the darker onboarding workspace.

Entrance transition: crossing into the shop

When the user clicks “Upload your materials here →”, create a smooth, cinematic zoom-in that makes the user feel as if they are entering the tailor shop. The transition should feel like crossing a threshold, not like a browser zoom or a generic screen swap.

Use a controlled scale/depth movement with restrained motion blur only if it improves the effect. Aim for approximately 600–900 milliseconds as a starting point, then tune against the actual landing artwork. Avoid aggressive camera movement, excessive blur, or a transition that delays the user.

As the zoom reaches its endpoint, transition into the focused onboarding interface. Respect reduced-motion preferences by substituting a short, subtle fade.

Notes / decisions: _____

4. Stage Two: Guided Onboarding

After the primary button is clicked, transition into a focused workspace using charcoal, dark brown, black, and restrained purple accents. This should feel like a guided process, not a dashboard or a giant form.

Onboarding background continuity

After the entrance zoom finishes, keep one consistent solid background throughout the entire onboarding sequence: both uploads, the existing mini quiz, and career-profile review/confirmation. Do not bring back the tailor-shop photograph or change backgrounds between these steps.

Use the established warm-black, charcoal, dark-brown, and restrained-purple palette. Keep the background visually quiet so upload controls, questions, and profile content remain the focus. Let panels and interface elements create any needed

depth without changing the underlying background.

Return to the full workspace

Only after the user confirms their career profile should the app transition into the personalized homepage. Reintroduce the layered tailor-studio treatment there: subtle texture, tonal variation, refined borders, depth, and floating workspace boxes. The progression should feel like entering the shop, completing a calm fitting process, and arriving at the main workbench.

Step A: Upload materials

Provide separate upload areas for the master resume and master achievement document.

Support drag-and-drop and file browsing, plus replacing, removing, and confirming files.

Show filenames, upload progress, and clear error states.

Use subtle visual feedback when files are added; keep the interface focused.

Notes / decisions: _____

Step B: Existing mini quiz

Use the questions already created for the project. Do not invent replacements or silently change their meaning.

Present questions in a comfortable sequence; use one question at a time when appropriate.

Include clear Back and Next controls and a subtle progress indicator.

Preserve answers when users navigate backward.

Use thoughtful transitions that do not slow down completion.

Notes / decisions: _____

Step C: Build and confirm the career profile

Use the uploaded materials and quiz responses to extract education, experience, skills, projects, accomplishments, interests, and career goals.

Organize the information into readable, editable sections.

Allow users to correct mistakes, add missing information, and remove irrelevant details.

Distinguish confirmed information from missing or uncertain information.

Never invent qualifications, achievements, work experience, skills, or metrics.

Require the user to confirm the profile before proceeding.

Notes / decisions: _____

Step D: Transition into the homepage

After required materials are uploaded, quiz questions are completed, and the profile is confirmed, transition into the personalized homepage. Make the transition feel meaningful but restrained, like entering the user's own tailoring studio. Avoid theatrical loading screens.

Notes / decisions: _____

5. Stage Three: Personalized Homepage

The homepage is the central experience and should feel like a sophisticated, personalized tailoring studio rather than a conventional SaaS dashboard. The workspace boxes are the main navigation. There must not be a permanently visible left sidebar.

Homepage composition

Use a restrained AGENT FROG brand treatment and a brief personalized welcome when a name is available.

Keep the homepage open, immersive, and uncluttered, with deliberate negative space.

Make the workspace boxes the main visual focus.

Include a small, unobtrusive button to open the hidden navigation drawer.

Show existing application activity or a resume-work prompt only when it provides genuine value.

Adapt to the user's actual state: no applications, unfinished work, or completed applications.

Do not fill the page with charts, metrics, notification panels, progress widgets, or multiple rows of generic cards.

Floating workspace boxes

Each box should contain its respective name and minimal visual detail. Avoid large icons, illustrations, long descriptions, and generic dashboard-card styling.

Workbench: create and tailor resumes and cover letters for specific job applications.

Prep: practice interviews, prepare for career conversations, and work on interview questions.

My Applications: access saved applications, track progress, and reopen previous work.

My Profile: review and update the user's career profile, resume, and achievement information.

Box styling and motion

Use deep charcoal, warm black, rich brown, muted purple, and restrained warm highlights.

Create depth with layered surfaces, fine borders, tonal variation, and carefully controlled shadows.

Use refined typography, thoughtful proportions, and enough negative space to make each workspace feel intentional.

Give each box a very small, slow vertical idle float. Slightly vary timing so the boxes do not move in perfect synchronization.

On hover, scale to approximately 1.03–1.05, subtly deepen the shadow, adjust the border or lighting, and gently strengthen the purple accent.

Keep the whole box clickable and provide a pointer cursor, keyboard focus state, and touch pressed state.

Avoid bouncing, dramatic rotation, excessive glow, or motion that distracts from reading.

Respect reduced-motion preferences and avoid layout shifts.

Notes / decisions: _____

6. Hidden Navigation Drawer

Provide full navigation without leaving a sidebar permanently visible. Place a small, refined menu button in a consistent location, preferably near the upper-left corner.

Opening and closing behavior

Clicking the button opens a dark overlay drawer that slides in from the left.

The drawer sits above the homepage content and does not permanently take up layout space.

Include a clear close button; also close when the user clicks outside the drawer or presses Escape.

Use restrained transitions, subtle borders, depth, and purple highlights.

On mobile, adapt the drawer to a comfortable full-height panel or similarly usable navigation surface.

Manage focus correctly, support keyboard navigation, and prevent keyboard focus from remaining behind an open overlay.

Drawer destinations

Home

Workbench

Prep

My Applications

My Profile

Source Materials

Settings

Only display sections that exist or are part of the established product plan. Connect every item to a real destination, avoid dead links, and use clear active-state styling.

Notes / decisions: _____

7. Stage Four: Workbench and Application Tailoring

The Workbench is the primary path from the homepage into a specific application. It should maintain the same visual language while becoming more focused and document-centered.

Let the user paste a job description or enter a job title and company. Start with pasted job descriptions if that keeps the MVP simple.

Identify the role's key qualifications, responsibilities, and skills.

Compare job requirements against the user's confirmed career profile.

Highlight matching experience, strengths, gaps, and missing qualifications.

Generate a tailored resume and an optional cover letter using only supported facts.

Highlight meaningful changes and explain why each important change was suggested.

Show original and proposed versions side by side where useful.

Allow users to accept, reject, edit, and revert individual changes.

Save progress and let users return later.

Keep the document as the focal point; avoid unnecessary charts, metrics, or decorative controls.

Notes / decisions: _____

8. Final Review and Export

Check spelling, grammar, consistency, formatting, and relevance to the target job.

Identify unsupported claims and gaps without inventing information.

Show a final preview of the resume and cover letter.

Use a conventional, professional, ATS-friendly layout for exported documents.

Allow users to download approved documents as PDF files and other formats only if supported.

Require explicit user approval before marking an application finalized.

Notes / decisions: _____

9. Prep, Applications, Profile, and Source Materials

Prep

Provide a focused place for interview practice, interview questions, and preparation for career conversations. Keep the design consistent and avoid introducing unnecessary features before the core workflow is reliable.

My Applications

Display saved applications in an editorial list or carefully designed workspace layout, not a wall of repetitive cards.

Show company, position, last updated date, and status.

Support reopening applications, continuing edits, reviewing versions, and accessing finalized documents.

Possible statuses: Draft, Ready to Submit, Applied, Interviewing, Offer Received, and Rejected.

My Profile and Source Materials

Let users revisit and update their career profile, resume, achievement document, and quiz responses.

Make it clear that changing the underlying profile does not silently overwrite previously approved applications.

Keep source material access easy to find without crowding the homepage.

Notes / decisions: _____

10. Visual System and Interaction Rules

Visual language

Palette: deep charcoal, warm black, rich walnut, muted brown, restrained purple, and warm off-white typography.

Use subtle grain, fine borders, tonal variation, controlled shadows, and layered surfaces.

Use refined serif typography selectively for editorial headings, paired with readable modern sans-serif typography for functional content.

Avoid bright gradients, excessive cards, endless grids, clutter, and standard startup-template aesthetics.

Use asymmetry only where it improves the composition; preserve readable hierarchy and comfortable spacing.

Motion

Use motion to communicate structure, state, and continuity.

Animate page transitions, question changes, upload feedback, panel states, and save/generation/finalization feedback subtly.

Use performant transforms and opacity changes where possible.

Page-to-page transition system

Every meaningful page or major route transition should use a smooth, consistent animation, not just the landing-to-onboarding entrance. Establish a shared transition language across Home, Workbench, Prep, My Applications, My Profile, Source Materials, and Settings.

Use subtle fades combined with small directional movement or a restrained scale change where appropriate. Keep transitions quick and purposeful, generally around 180–300 milliseconds for ordinary navigation. Reserve the longer 600–900 millisecond cinematic zoom for the initial tailor-shop entrance.

Keep the interface responsive during transitions. Avoid long blocking animations, dramatic page flips, excessive blur, or transitions that make users wait to complete frequent tasks. Prefer opacity and transform animations, avoid layout shifts, and keep focus and keyboard navigation correct as the destination changes.

Use consistent enter/exit timing and easing across the app, while allowing the motion to reflect context: a drawer slides, a question changes cleanly, a page transitions subtly, and the initial entrance feels more cinematic. Do not animate every element independently or add motion without a usability purpose.

If Motion or Framer Motion is already installed, build on the existing setup rather than adding unnecessary dependencies.

Avoid constant parallax, busy animated backgrounds, excessive bouncing, and motion that slows common actions.

Respect reduced-motion preferences throughout the app.

Accessibility and responsive behavior

Ensure every workspace box is keyboard-accessible and has a visible focus state.

Make the drawer usable with keyboard navigation and correct focus management.

Provide touch interaction states where hover is unavailable.

Ensure the layout adapts to desktop, tablet, and mobile.

Include loading, empty, error, success, and validation states wherever relevant.

11. Implementation Order

Inspect the current codebase, routing, components, existing quiz questions, templates, data flow, and installed skills before changing anything.

Preserve working functionality and reuse existing components where sensible.

Implement the landing page and the full upload → quiz → profile confirmation onboarding flow.

Implement the transition into the personalized homepage.

Build the floating Workbench, Prep, My Applications, and My Profile workspace boxes.

Implement the hidden overlay navigation drawer and all valid destinations.

Build or connect the Workbench job-description and application-tailoring flow.

Complete final review, export, application management, and supporting profile/source-material features.

Use Frontend Design, UI/UX Pro Max, Superpowers, and Motion skills where applicable.

Implement the changes in the actual application; do not stop at a plan or disconnected mockups.

12. Acceptance Checklist

- ■ A new user starts on the immersive AGENT FROG landing page, not the dashboard.
- ■ The landing button transitions to the darker onboarding workspace.
- ■ The user can upload/replace/remove the master resume and achievement document.
- ■ The existing mini quiz is used, answers persist, and progress is clear.
- ■ The career profile can be reviewed, edited, and confirmed.
- ■ Successful onboarding transitions into the personalized homepage.
- ■ No permanent left sidebar appears on the homepage.
- ■ The homepage is centered on floating workspace boxes with minimal labels.
- ■ Boxes float subtly at rest and enlarge slightly on hover without layout shifts.
- ■ Reduced-motion settings are respected; touch and keyboard interaction work.
- ■ The navigation drawer opens from a small button, overlays content, and closes via button, outside click, or Escape.
- ■ All navigation destinations work and there are no dead links.
- ■ Workbench supports a real job-description-to-tailored-document workflow.
- ■ No fabricated user qualifications or accomplishments are introduced.
- ■ The final resume export is conventional and ATS-friendly.
- ■ The full journey is tested in a browser across desktop and mobile.

13. Decisions and Notes

_____

_____

_____

_____

_____

_____

_____

_____

- ■ Clicking the landing-page button triggers a polished zoom-in entrance into onboarding.
- ■ One solid background remains consistent across uploads, quiz, and profile confirmation.
- ■ Confirming the profile transitions into the fully layered personalized homepage.
- ■ Meaningful page-to-page navigation uses a consistent, smooth transition system.
- ■ The initial entrance zoom is more cinematic than ordinary navigation transitions.

Final direction: the landing page, onboarding, homepage, and tailoring workspace should feel like different rooms in the same environment. The homepage is the destination, the floating workspaces are the main entry points, and the full navigation appears only when requested.
